

Grid connected
**WIND and
PHOTOVOLTAIC SOLAR**
are a
SCAM !

Intermittent electricity is virtually useless at any significant scale, but vested interests like the fossil fuel industry and ideological groups have promoted it in order to obstruct the only scalable, reliable, super-low-carbon source of power — nuclear.

The good news... Nuclear alone can fix climate change. Whatever limited hydro or geothermal generation is available can also help.

The bad news... But intermittent generation serves no useful purpose once it exceeds the power from balancing sources like hydro.

Contrary to what you've been told... There is no way to store power from wind or photovoltaic solar without it ceasing to be low-carbon, nor is there any realistic hope of such storage being invented. Nor is there any point in combining wind or photovoltaic solar with nuclear, because that means the power from wind and solar is simply redundant.

So... Don't let politicians lead us down a hopeless path by building more intermittent power generation. Don't believe what almost everyone (even the nuclear industry) tells you. Instead, investigate the arguments, verify those widespread assumptions, look behind the ready-made conclusions, critically read the (allegedly) technical reports, or just think!! It's actually not that complicated.

Question...

At first glance, powering our society with intermittent, low-intensity electricity from wind turbines and photovoltaic generation seems a crazy and unworkable idea, especially since large-scale electricity cannot be efficiently stored. So why is the world attempting just this, and betting the future of the planet on it succeeding?

Answer....

It is happening, presumably, for the same reason similar mad narratives have directed societies into suicidal policies throughout history. For example, Lysenkoism killed millions in the Soviet Union because an ideological doctrine was preferred to proven science. China's "Great Leap Forward" had similar effects for similar reasons. And there are other examples.

Now, the Western-influenced world is having its own ideological pseudo-technology anti-science spasm, with far more devastating environmental and human welfare effects. **But we are free to stand up and point out the obvious truth....**

Building wind or photovoltaic generation to fix climate change is like building a wooden ladder to get to the moon. At first it might seem to be working, but it isn't going to get us all the way there, and part way is useless.
